You Have Deployed Gemini in Google Workspace. Here Is How to Turn Seats Into Adoption at Retail Scale.

WRITING SAMPLE BY TAHA SIDDIQUI. A SUCCESS STORY TURNED INTO A DECISION STAGE BLOG. CLIENT ANONYMISED. NOT YET PUBLISHED.

80 to 90%

ORGANIZATIONAL ADOPTION

What a 12 week enablement program did for a global retailer after Gemini in Google Workspace was already live across 5,200+ employees.

The decision in front of you

If you have already rolled out Gemini in Google Workspace across a large workforce, the technology decision is behind you. The decision in front of you is harder and more consequential: whether those seats become working habits or quietly lapse before the next budget review. That is a bottom of the funnel problem, and it has a repeatable answer.

Where 66degrees came in

66degrees was brought in by a global retailer at exactly this stage. The deployment was live, the workforce was vast and distributed, and leadership needed adoption it could measure alongside a security posture that could withstand an AI layer running across the entire Workspace estate.

What the engagement did, in the order it mattered

FIRST, WE HARDENED THE GROUND

A full security assessment with guardrails across identity and access management, data loss prevention, and device management, so the AI went live inside a controlled perimeter.

THEN WE MADE ADOPTION VISIBLE

An automated dashboard on BigQuery and Tableau showing which features were used, by which groups, and where engagement lagged.

THEN WE DROVE THE BEHAVIOR CHANGE

A 12 week program with a tiered L100 to L300 learning path built by persona for sales, marketing, HR, and customer service, reinforced by an onsite bootcamp.

FINALLY, WE MADE IT SELF SUSTAINING

A Train the Trainer AI Champions program that seeded internal momentum so adoption kept compounding after the engagement closed.

The outcomes are the reason to act now

5,200+
employees upskilled

80 to 90%
organizational adoption

100%
security assessment and configuration framework completed

35
senior merchandising managers building their own automation workflows

The program upskilled more than 5,200 employees, lifted organizational adoption into the 80 to 90 percent range, held the security assessment and configuration framework to 100 percent completion, and trained 35 senior merchandising managers to build their own automation workflows. Independent research still finds most enterprise generative AI pilots return nothing measurable. The difference here was an engagement engineered for adoption from the first week.

Internal team or partner

If you are weighing whether to run this internally or bring in a partner, the honest calculus is speed and risk. An internal team can eventually assemble the security review, the measurement layer, and the persona curriculum. A partner who has already done it removes the trial and error, compresses the work into a defined engagement, and carries the governance discipline so a productivity gain does not become a security exception. The AI Champions model is built to hand the capability back to your people, so the momentum stays after we step back.

Engineering AI Workforce Enablement with 66degrees

The organizations that see a return on a Workspace AI investment are not the ones that provision the most seats. They are the ones that engineer adoption, measurement, and governance together, on a defined timeline, before the seats lapse. This is how AI ambition becomes an operating reality rather than a line item. If your deployment is live and adoption is the open question, book a working session with 66degrees, and we will map your rollout, your personas, and your security gaps against a clear enablement plan.
